YOUR INVOICE OUR ENVELOPE
THE WORLD GETS IT

What is Enveloped Mode?

Invoicing for global businesses used to be simple. You created a PDF, sent it to your customer, and the process was complete. It was straightforward, consistent, and rarely required specialized systems.

Today, things are much more complicated. Governments around the world have introduced electronic invoicing systems, each with its own technical requirements and tax reporting rules. These systems aim to improve compliance and transparency, but they have also added significant complexity for companies that operate internationally.

When using networks such as Peppol, businesses must also follow specific standardized formats such as UBL, CII, XRechnung, FacturX, or Fattura PA. Each of these formats serves a similar purpose but comes with its own structure, validation rules, and integration requirements.

For industries such as automotive, foodservice, and retail, the challenge is even greater. These sectors often depend on long-established EDI connections and file transfer methods such as FTP, SFTP, AS2, or OFTP, which are deeply embedded in their supply chain operations. Integrating these older systems with modern e-invoicing standards can be both costly and time-consuming.

The result is a complex web of formats, regulations, and connections that businesses must navigate simply to send a single invoice. Every step introduces the potential for errors, and even small mistakes can lead to delays, rejected transactions, or financial penalties.

That's where Storecove comes in.

Instead of dealing with countless formats, connections, and compliance rules, you can simply send your document through our API in its original form. This could be an EDIFACT, XML, JSON, UBL, or even a flat file. Your document is then placed in a secure, compliant envelope and delivered directly to its destination through the Peppol network. That destination might be a government portal, a mandated platform, a corporate ERP system, or a tax authority.

With this 'Enveloped Mode' solution, you gain the full benefits of the Peppol open exchange network, including:

- low costs;

- no roaming fees;

- secure AS4 connections

- participant validation;

- standardized identifiers;

- and reliable message delivery.

You can continue to use the formats your business partners already expect. Each document automatically finds the correct destination, transport method, and level of encryption. There is no need to maintain manual routing tables or outdated connections. Your data remains encrypted from start to finish, ensuring full security even in highly regulated industries.

This approach is ideal for companies with complex EDI systems that want to move to Peppol without changing their existing infrastructure. It also suits IT teams that want to simplify global integrations. The result is faster, safer, and truly borderless document delivery, with every file arriving exactly as intended.

30-Day Testing

Free your business from unnecessary complexity and make sure your documents reach their destination without delays or compliance issues. There is no need to coordinate between multiple IT teams or deal with last-minute rejections from tax authorities.

Request a 30-day test account today, send us your files, and experience how simple reliable document delivery can be. The regulatory landscape may be growing more complex, but your invoicing does not have to.
